

PulseBet AI

TxLINE Hackathon Demo Script

Target Duration: ~3.5 Minutes

0:00 - 0:30 Introduction & The Problem

SCREEN ACTION

Start on the clean dashboard before connecting wallet. Keep the cursor still to let the judges absorb the UI.

YOU: "Hi judges! Most fans watching the World Cup are glued to their phones, but the betting experience is completely disconnected from the actual flow of the game. You stare at a spreadsheet of static odds. It's boring, and it's not made for fans. For the TxLINE hackathon, I built PulseBet AI—a platform that transforms the raw TxLINE data feed into dynamic, AI-driven 'Micro-Wagers' that let fans bet on the direct momentum of the match on Solana."

0:30 - 1:15 Fan Accessibility & UX

SCREEN ACTION

Click 'Select Wallet', show the custom frosted-glass modal, and connect Phantom. Show the scoreboard.

YOU: "To make this accessible to mainstream fans, the UX has to rival a native iOS app. We built a gorgeous, icy glassmorphic UI. Connecting our Solana wallet is totally seamless. The scoreboard uses official high-res SVG flags fetched via the country ISO codes from the TxLINE schema, and the massive typography makes it instantly readable."

1:15 - 2:00 Real-Time Responsiveness & AI Engine

SCREEN ACTION

Scroll down slightly to show the Pulse Feed and the Momentum Bar. Highlight the newly generated AI Pundit pulse feed card.

YOU: "We wanted to deliver true real-time responsiveness—not just regurgitate an API feed. So, I built an AI agent that constantly monitors the TxLINE JSON payload in the background. Because there are no live games right now, we are simulating a live TxLINE socket at the 67th minute of the World Cup Final. Watch what happens here... The AI detected a massive odds shift on TxLINE. It instantly analyzed the match stats, generated a human-readable explanation—Mbappé has 4 shots, pressing intensity is up 34%—and automatically generated a highly contextual, 5-minute Micro-Wager: *Will France score the next goal?*"

2:00 - 2:45 Execution (The Solana Bet)

SCREEN ACTION

Scroll to the Micro-Wager Card. Click "Yes" and click "Place 0.01 SOL Wager". Approve in Phantom wallet. Show green success receipt.

YOU: "Instead of scrolling through 100 different markets, the AI brings the exact right bet to the user at the exact right time. Let's take the bet. The frontend instantly constructs a Solana transaction. I approve it in Phantom... And boom. A gorgeous, satisfying success receipt. To prove this isn't just a UI mockup, if we click 'View on Solana Explorer', you can see the transaction is fully finalized on Devnet right now, proving our end-to-end execution."

2:45 - 3:30 Commercial Monetization & Outro

SCREEN ACTION

Leave it on the beautiful green Success receipt (or briefly scroll back up to the dynamic momentum bar).

YOU: "From a commercial perspective, this model is highly monetizable. By using AI to trigger hyper-specific, time-limited micro-wagers during peak emotional moments of a match, operators can drastically increase user engagement and betting volume. PulseBet AI proves that by combining the speed of the TxLINE data layer with Solana's micro-transactions, the future of sports betting isn't spreadsheets—it's interactive, AI-driven entertainment. Thank you!"

Recording Pro-Tip

When you mention simulating the live TxLINE socket at the 1:15 mark, consider doing a quick split-screen or showing a small terminal window tailing the raw JSON data for just 2-3 seconds before snapping back to the UI. Hackathon judges absolutely love seeing the "engine" working under the hood right before seeing the frontend magic.
